Observationes Desectus Lunaris Grenovici habitæ in observatorio Regio Februarij 1682. p.m. à Johanne Flamsteedio Math.

Reg.

UT Testis esset & particeps harum Observationum Vespera præcedente Grenovicum devenerat D's. Halleius, aderat brevi postea Ds. Haltonus Amicus meus singularis & Geometra peritissimus, cum alijs nonnullis Matheseos studiosis. Hora 8h. 01 Tubo pedum 16, Luna cepi Diametrum 6702 331.25", deinde distantiam Limbi ejus proximi a Limbo proximo Mareotidis 145-0' 43"; sed ejusdem Limbi Maculæ a Limbo Lunæ remotiore 6575-32' 48": Hora 8h 49m Oram Luna inferiorem Fumus capit inficere Eclipfis mox ingruentis prænuncius. Constitueramus Turbæ vitandæ causa seorsim observare, Recessit ergo Ds. Halleius cum Amanuensi meo Tho. Fabro ut per Telescopia supra Sextantem Phasibus invigilarent, manente mecum D. Haltono. Tubousus sum antedicto pedum 16 cum Micrometro; cujus ope nedum Umbræ ad Maculas appulsus sequentes, sed etiam Tempora, cum Obscuratio ad centrum Luna pertigerit, & cum Radius ejus arcus in Peripharia deficientes vel restitutos subtenderits obtinui; è quibus medium derivari potest, forsan non minus accurate, quam ab Observatis Initio & Fine Immersione & Emersione collatis.

Hisce alias ejusdem Desettus Animadversones Londini in Vico Basingensi à D. Haynesso Tubo pedum g factas addidi tum propter earum cum nostris Consensum, tum ut inde innotescar quam non difficile sit accurate Lunaris Eclipsis Phases determinare, quicquid inexperti è contrario edisserunt, si modo attenti sint, & necessarijs pauculis Instrumentis instructi Calispices.
